Modelling signaling networks

Published on 31 January 2011

Marc Bailly-Bechet et al. have developed a new algorithm for the signaling network inference problem, and applied it to transcriptomic and proteomic data in yeast. The predictions of the new algorithm are confirmed experimentally. This new method can be applied to many network inference problems, and the algorithm performance in terms of speed and complexity make it able to treat large-scale networks such as the human signaling network.
